

# Zapier Lead Qualification & CRM Automation

Portfolio Case Study - Webhook, HubSpot, Slack, Gmail

---

## Project Overview

Built a multi-step Zapier automation that receives lead data through a webhook, qualifies the lead by budget, creates or updates the contact in HubSpot, notifies the sales team in Slack, and sends a personalized confirmation email through Gmail.

### Business Goal

Automate qualified lead intake and follow-up.

### Trigger

Webhook POST request with JSON lead data.

### Qualification

Budget > 999 filter.

### Outputs

HubSpot CRM + Slack + Gmail.

## Tools Used

Zapier | Webhooks | Bruno | HubSpot CRM | Slack | Gmail

# Automation Architecture

End-to-end workflow built in Zapier

**Flow: Catch Hook -> Filter -> HubSpot -> Slack -> Gmail**

# 1. Webhook Trigger & API Testing

Lead data sent as JSON from Bruno to the Zapier Catch Hook

- Sent POST requests with JSON fields for name, email, company, budget, and service.
- Verified the endpoint returned HTTP 200 success before continuing the workflow.
- Webhook URL was redacted in this portfolio for security.

## 2. CRM Integration - HubSpot

Qualified leads are created or updated in HubSpot

The screenshot displays the HubSpot CRM interface. The top navigation bar includes a search bar labeled "Find or Ask", a "Upgrade" button, and user information for "Abdiel". The left sidebar contains navigation links for Home, Contacts, Companies, Deals, Tasks, Marketing Emails, Segments, Workflows, and Prospecting Agent. The main content area is titled "Contacts" and shows a list of contacts under the "All contacts" tab. The list includes columns for Name, Email, Phone Number, Contact owner, and Primary. Four contacts are visible in the list.

|                          | Name                                    | Email                                      | Phone Number | Contact owner | Primary                             |
|--------------------------|-----------------------------------------|--------------------------------------------|--------------|---------------|-------------------------------------|
| <input type="checkbox"/> | > P <a href="#">pabua.ralph55@g...</a>  | <a href="#">pabua.ralph55@gmail.com...</a> | --           | No owner      | --                                  |
| <input type="checkbox"/> | > J <a href="#">john@example.com</a>    | <a href="#">john@example.com</a>           | --           | No owner      | <input checked="" type="checkbox"/> |
| <input type="checkbox"/> | > <a href="#">Brian Halligan (Sa...</a> | <a href="#">bh@hubspot.com</a>             | --           | No owner      |                                     |
| <input type="checkbox"/> | > <a href="#">Maria Johnson (Sa...</a>  | <a href="#">emailmaria@hubspot.com...</a>  | --           | No owner      |                                     |

- Mapped the webhook email to HubSpot Contact Email and company to Company Name.
- Used Create or Update Contact to avoid duplicate records when the same email is submitted again.

# 3. Internal Notification - Slack

Sales-team notification for qualified leads

- Posted a dynamic Slack notification using the live webhook values from the published Zap.
- The updated screenshot shows the real test lead: Ralph Pabua, Test Company, budget 9000, Web Development.

## 4. Personalized Lead Confirmation - Gmail

Automated follow-up email after a lead passes qualification

- Sent a personalized confirmation using dynamic lead fields from the original webhook.
- Verified end-to-end delivery with a real test email after publishing the Zap.

# Skills Demonstrated

What this project proves to an employer

---

- Webhook integration and JSON payload handling
- API testing with Bruno and HTTP response validation
- Conditional logic using Zapier Filter
- Dynamic field mapping across multiple applications
- CRM automation with HubSpot
- Slack notification automation
- Personalized email automation with Gmail
- Testing, debugging, and publishing multi-step Zaps

## Portfolio Summary

Designed and built a production-style lead automation in Zapier using a webhook trigger, budget qualification, HubSpot CRM integration, Slack notifications, and Gmail follow-up. The workflow was tested end-to-end with live sample data and published successfully.
