

Developer Application Screening Automation

n8n Portfolio Case Study - Form, JavaScript, Supabase, Conditional Routing, Google Sheets

Project Overview

Built an automated developer application screening workflow in n8n. Applicants submit a form, JavaScript processes and scores the application, the complete record is stored in Supabase, and conditional logic routes the applicant to the appropriate Google Sheet based on the screening result.

Business Goal

Reduce manual review of developer applications.

Trigger

n8n Developer Application Form submission.

Processing

JavaScript scoring and application data transformation.

Storage & Routing

Supabase database + IF branching + Google Sheets.

Tools Used

n8n | JavaScript | Supabase | Google Sheets | Conditional Logic

Automation Architecture

Complete n8n workflow for screening and routing applications

Flow: Form Submission -> JavaScript -> Supabase -> IF -> Google Sheets

1. Developer Application Form

Captures applicant details directly through n8n

Developer Application Form - Google Chrome

Submit

Form automated with n8n

- Collected name, email, years of experience, primary skill, and optional portfolio URL.
- Used the form submission as the workflow trigger so processing starts automatically.

2. Processing, Scoring & Conditional Logic

JavaScript evaluates the application before routing

- A JavaScript code node transforms the submitted data and calculates a screening score.
- The IF node uses the processed result to route applicants through true/false branches.
- Execution indicators confirm the successful path through the workflow during testing.

3. Persistent Storage - Supabase

Application records are saved before downstream routing

The screenshot shows the Supabase Table Editor interface for the 'applications' table. The table contains 10 rows of application records. The columns are: name, email, years_experience, primary_skill, portfolio_url, submitted_at, score, and status. The interface includes a sidebar with navigation icons, a top bar with project information, and a table editor with filters and sorting options.

- Stored applicant fields such as name, email, experience, skill, portfolio URL, score, and status.
- Supabase provides a centralized database record independent of the final Google Sheets routing.

4. Screening Results - Google Sheets

Processed applicants are logged with score and final status

- Recorded processed application data including score and screening status.
- Example outcomes include 'Accepted for interview' and 'Needs manual review'.
- Separate IF branches can route different screening outcomes to different sheets or tabs.

Skills Demonstrated

What this n8n project shows to an employer

- n8n workflow design and multi-node automation
- Form-triggered workflow execution
- JavaScript code-node logic and data transformation
- Applicant scoring and rule-based screening
- Supabase database integration and persistent record creation
- Conditional branching with the IF node
- Google Sheets integration and result routing
- Field mapping across multiple systems
- Workflow testing and execution verification

Portfolio Summary

Designed and built an n8n developer-screening automation that collects applications, processes and scores them with JavaScript, stores records in Supabase, and routes results through conditional logic into Google Sheets. The project demonstrates practical workflow automation, data mapping, database integration, and rule-based decision making.
